

Beyond The Blue Light : A New Era of Connection

Try Pitch

Why do we need lightless rectangles ?

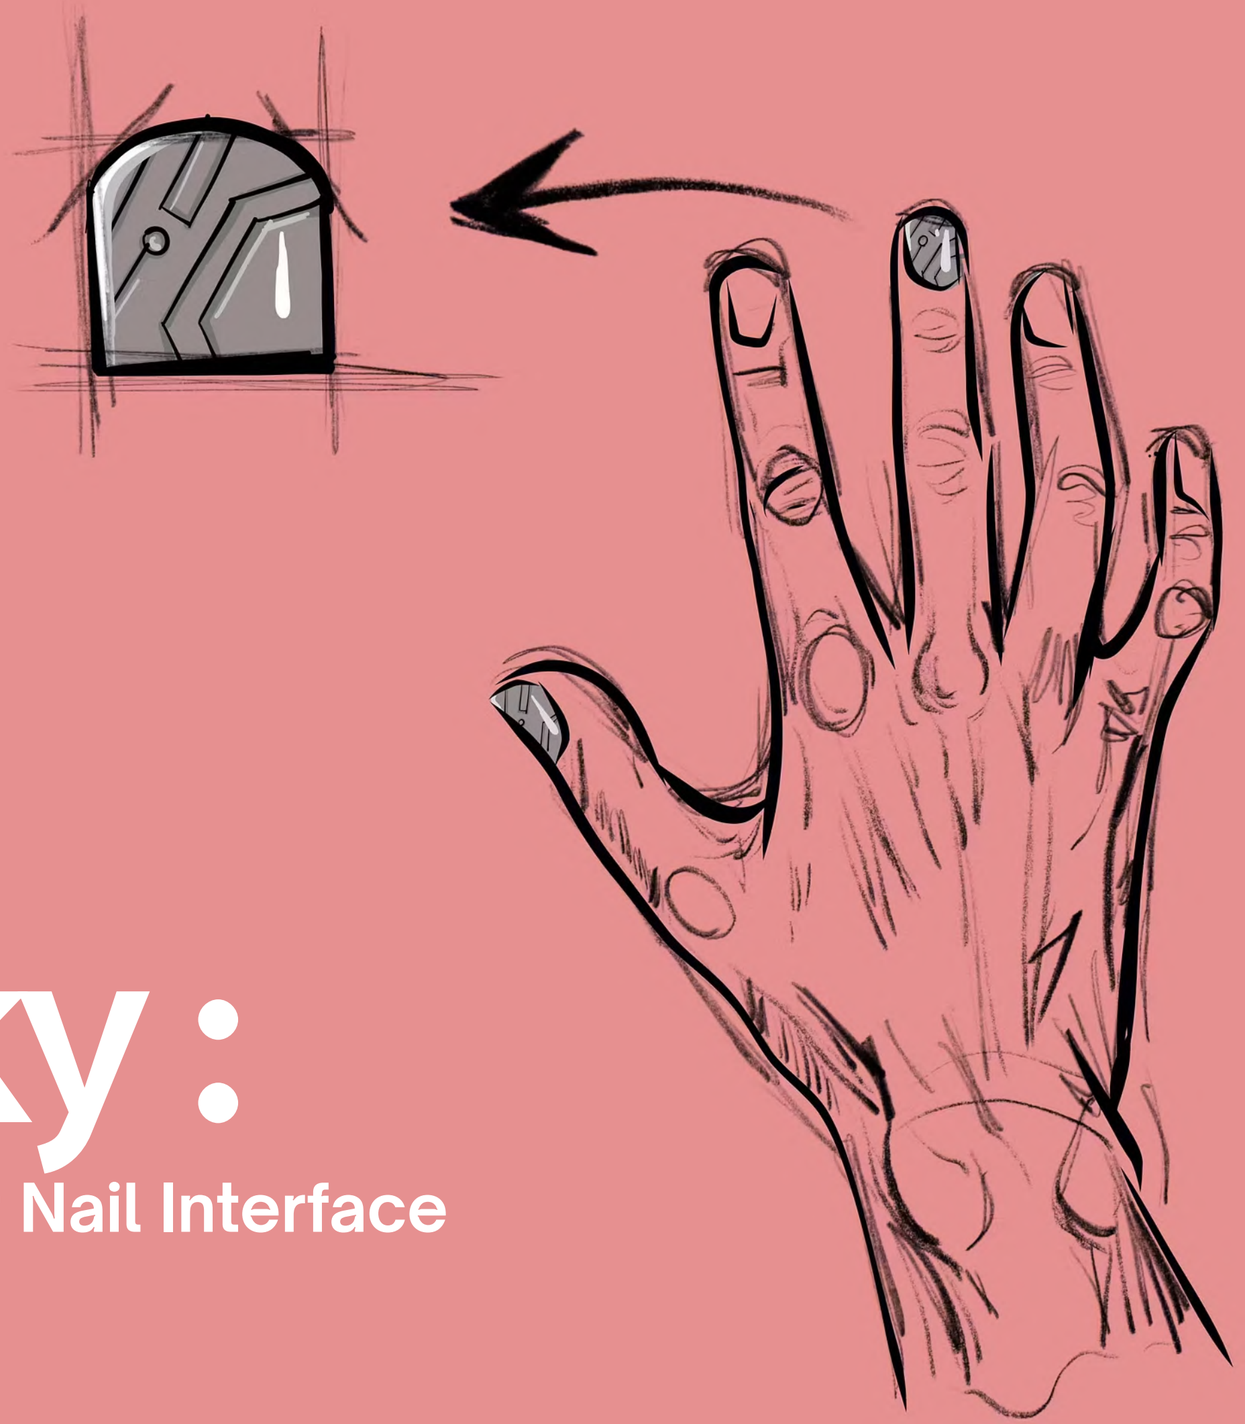

Devices today rely on screens, buttons, and sound

Inaccessible while moving (biking, cooking, commuting)

Disruptive in quiet spaces (meetings, public transport)

Not inclusive for hearing/speech-impaired individuals

Try Pitch

Flicky :

Modular Smart Nail Interface

Try Pitch

Flicked In:

A microphone that transforms your fingertips into a gesture-powered communication interface.

Try Pitch

Scroll Gesture

- Swipe up: Increases volume
- Swipe down: decreases volume

Tap Gesture

Call Cancel

Single tap: Instantly rejects or ends call.

Interaction:

Flicky uses its motion and pressure sensors to detect the distinct "tap" pattern

Try Pitch

Clap. Speak. Connect

Simple. Natural. Instant communication at your fingertips.

Try Pitch

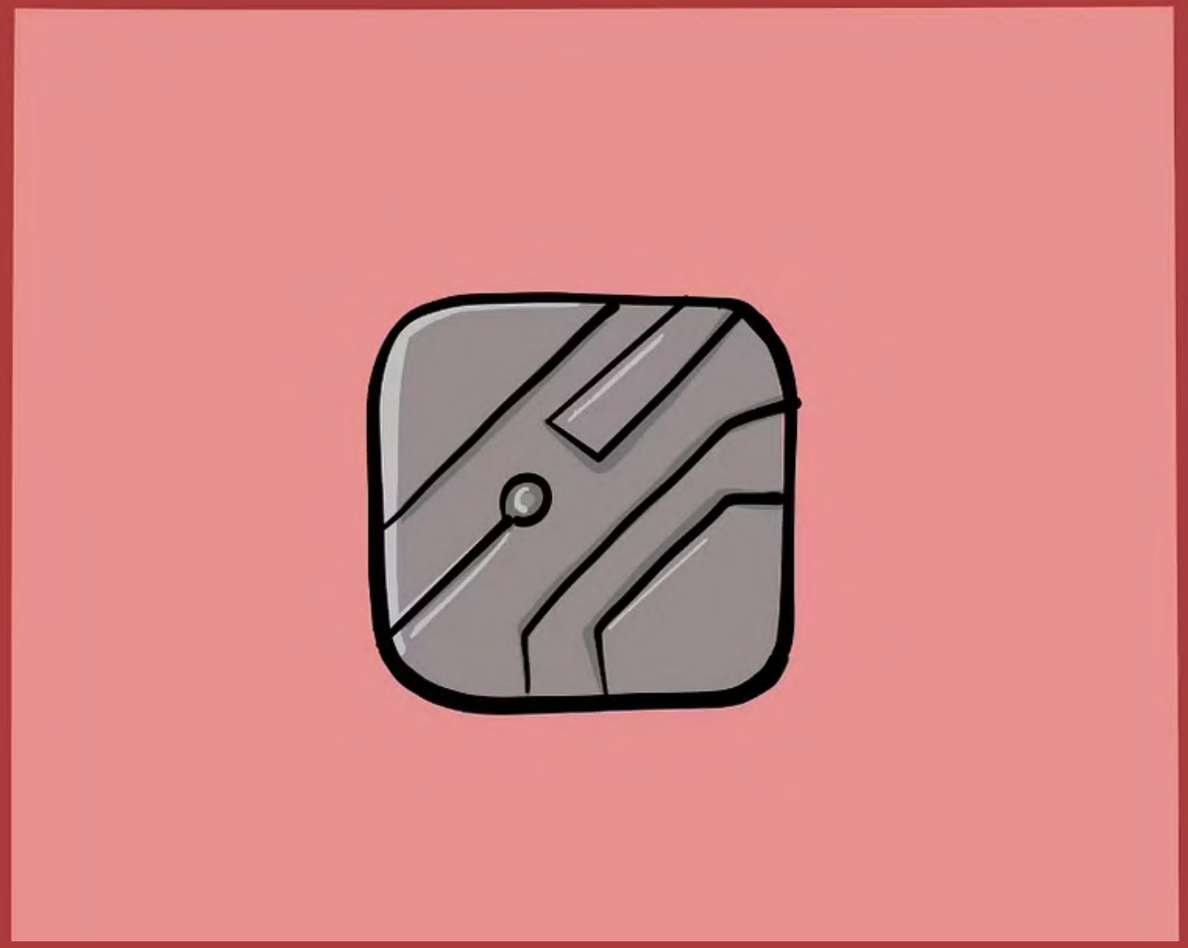

Draw your words into the Air

Flicky translates finger motion into direct communication

Try Pitch

The Silent Interface:

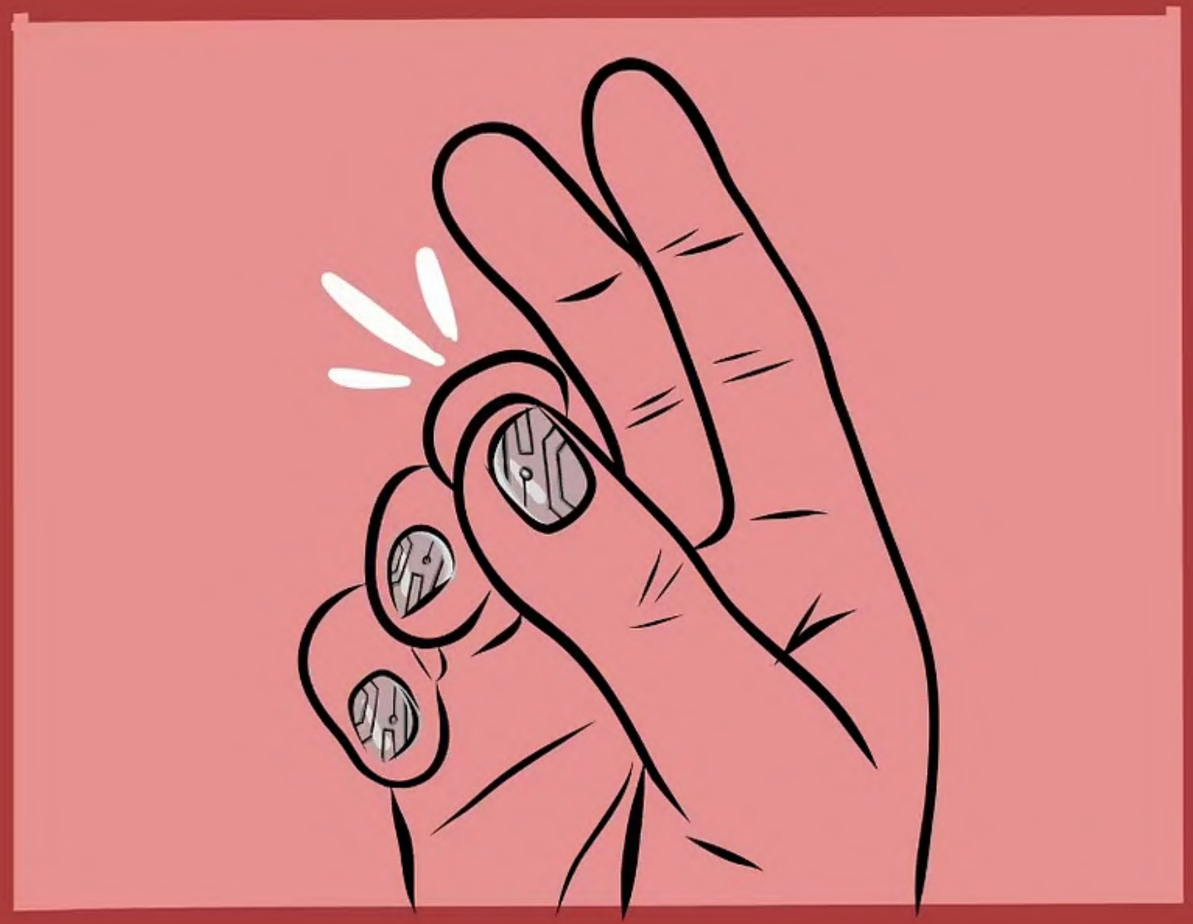

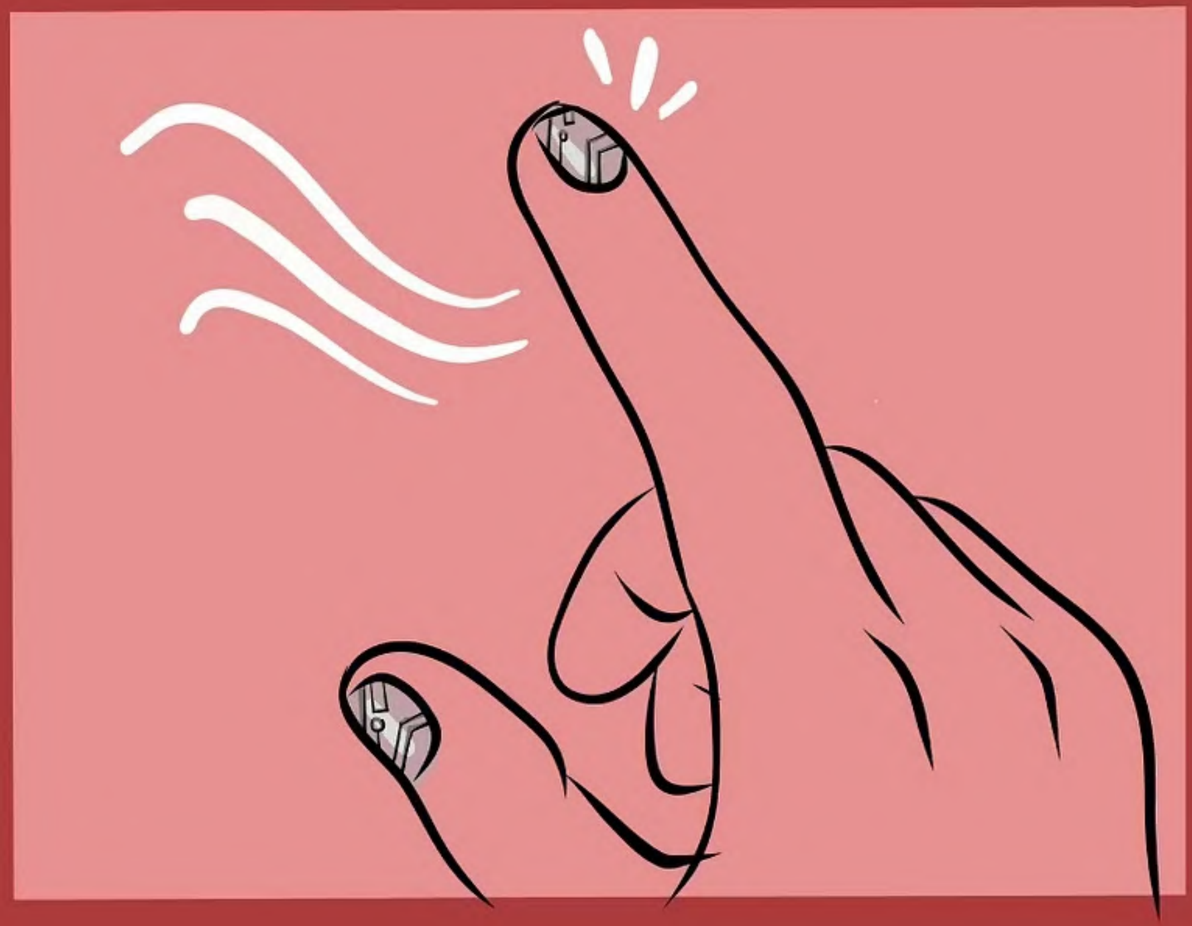

Introducing FLICKY - a seamless micro device that binds with your nails. No screen, no buttons. Just You.

Applied just like a nail-embedded with AI, Biometrics, and gesture sensors. Installed in secnds.

Try Pitch

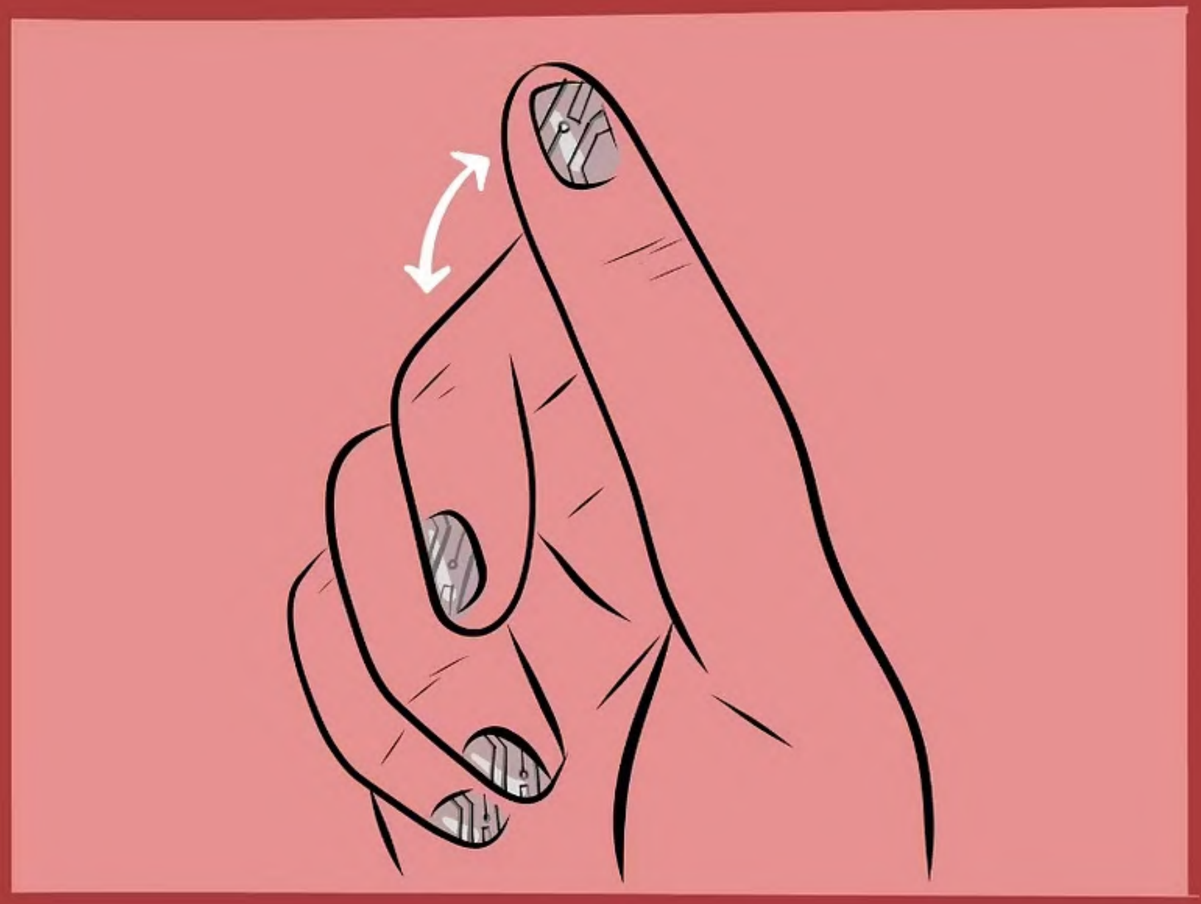

Activate with simple gesture,
Your body is the interface.

Call, text, or send thoughts directly. No devices- your hand becomes the communicator.

Try Pitch

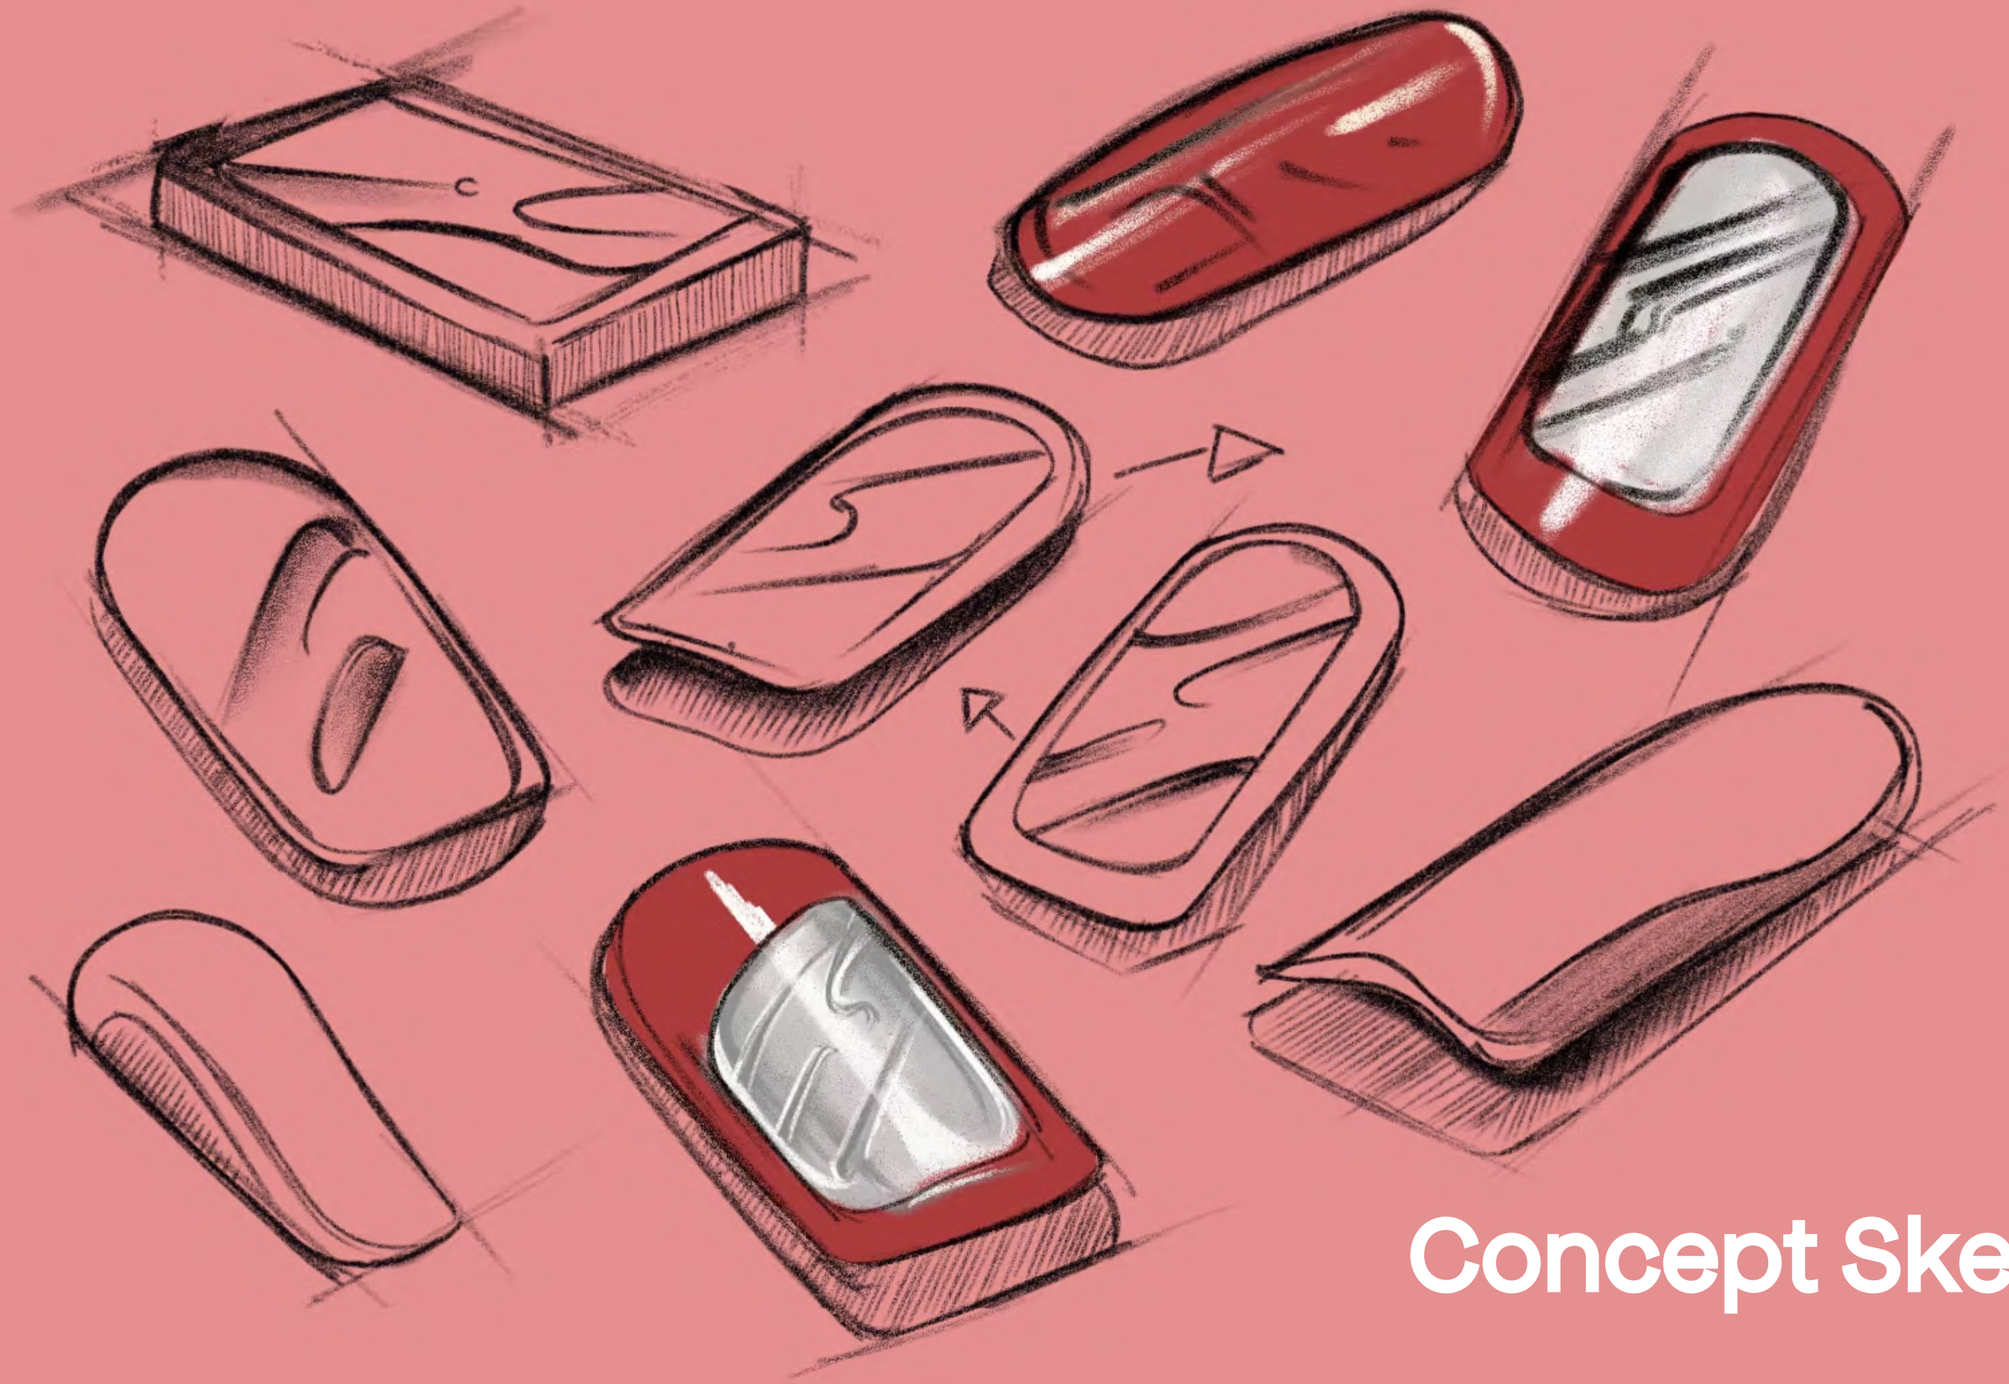

Messages are received via haptic pulses or audio directly through the skin.

"Tech that speaks your language - anytime, anywhere"

Prototype :

Try Pitch

Modularities:

- Voice commands such as "Call A" to make a call.
- Haptic feedback on interaction through soundless vibrations.
- Gesture and movement sensing through an embedded ML chip to detect movement.
- Temperature sensing through thermal sensors.
- Bone induction can be used to vibrate finger muscles which can listen to the voice and send it to the ear.

For charging, use of thermoelectric generators that can generate and recharge from body heat.

Personal Input:

- Clap to make a call.
- Snap to send a message.
- Roll the finger to increase/decrease the volume.
- Reject the call by simply tapping.

Communication:

- Calling through voice commands
- Receiving calls through micro-vibrations in the ear.
- Notifications are displayed by a small light blink.
- Notifications related to calls will be displayed through long light blink.

Try Pitch

Technological Factors in FLICKY :

ML Chip : TinyML chips like **Ambiq Apollo4 Blue** or **Edge Impulse-compatible MCUs** can fit.

Microphone Array : Knowles SPH0645.

Battery : Ilika or Cymbet batteries.

Haptic Feedback : Bone Conduction Transducers

Wireless Communication : NFC/Ultra-wideband(UWB)

Gesture/Touch : Capacitive Touch Sensors & IR Proximity Sensors

Lighting/Notification : Micro-LEDs

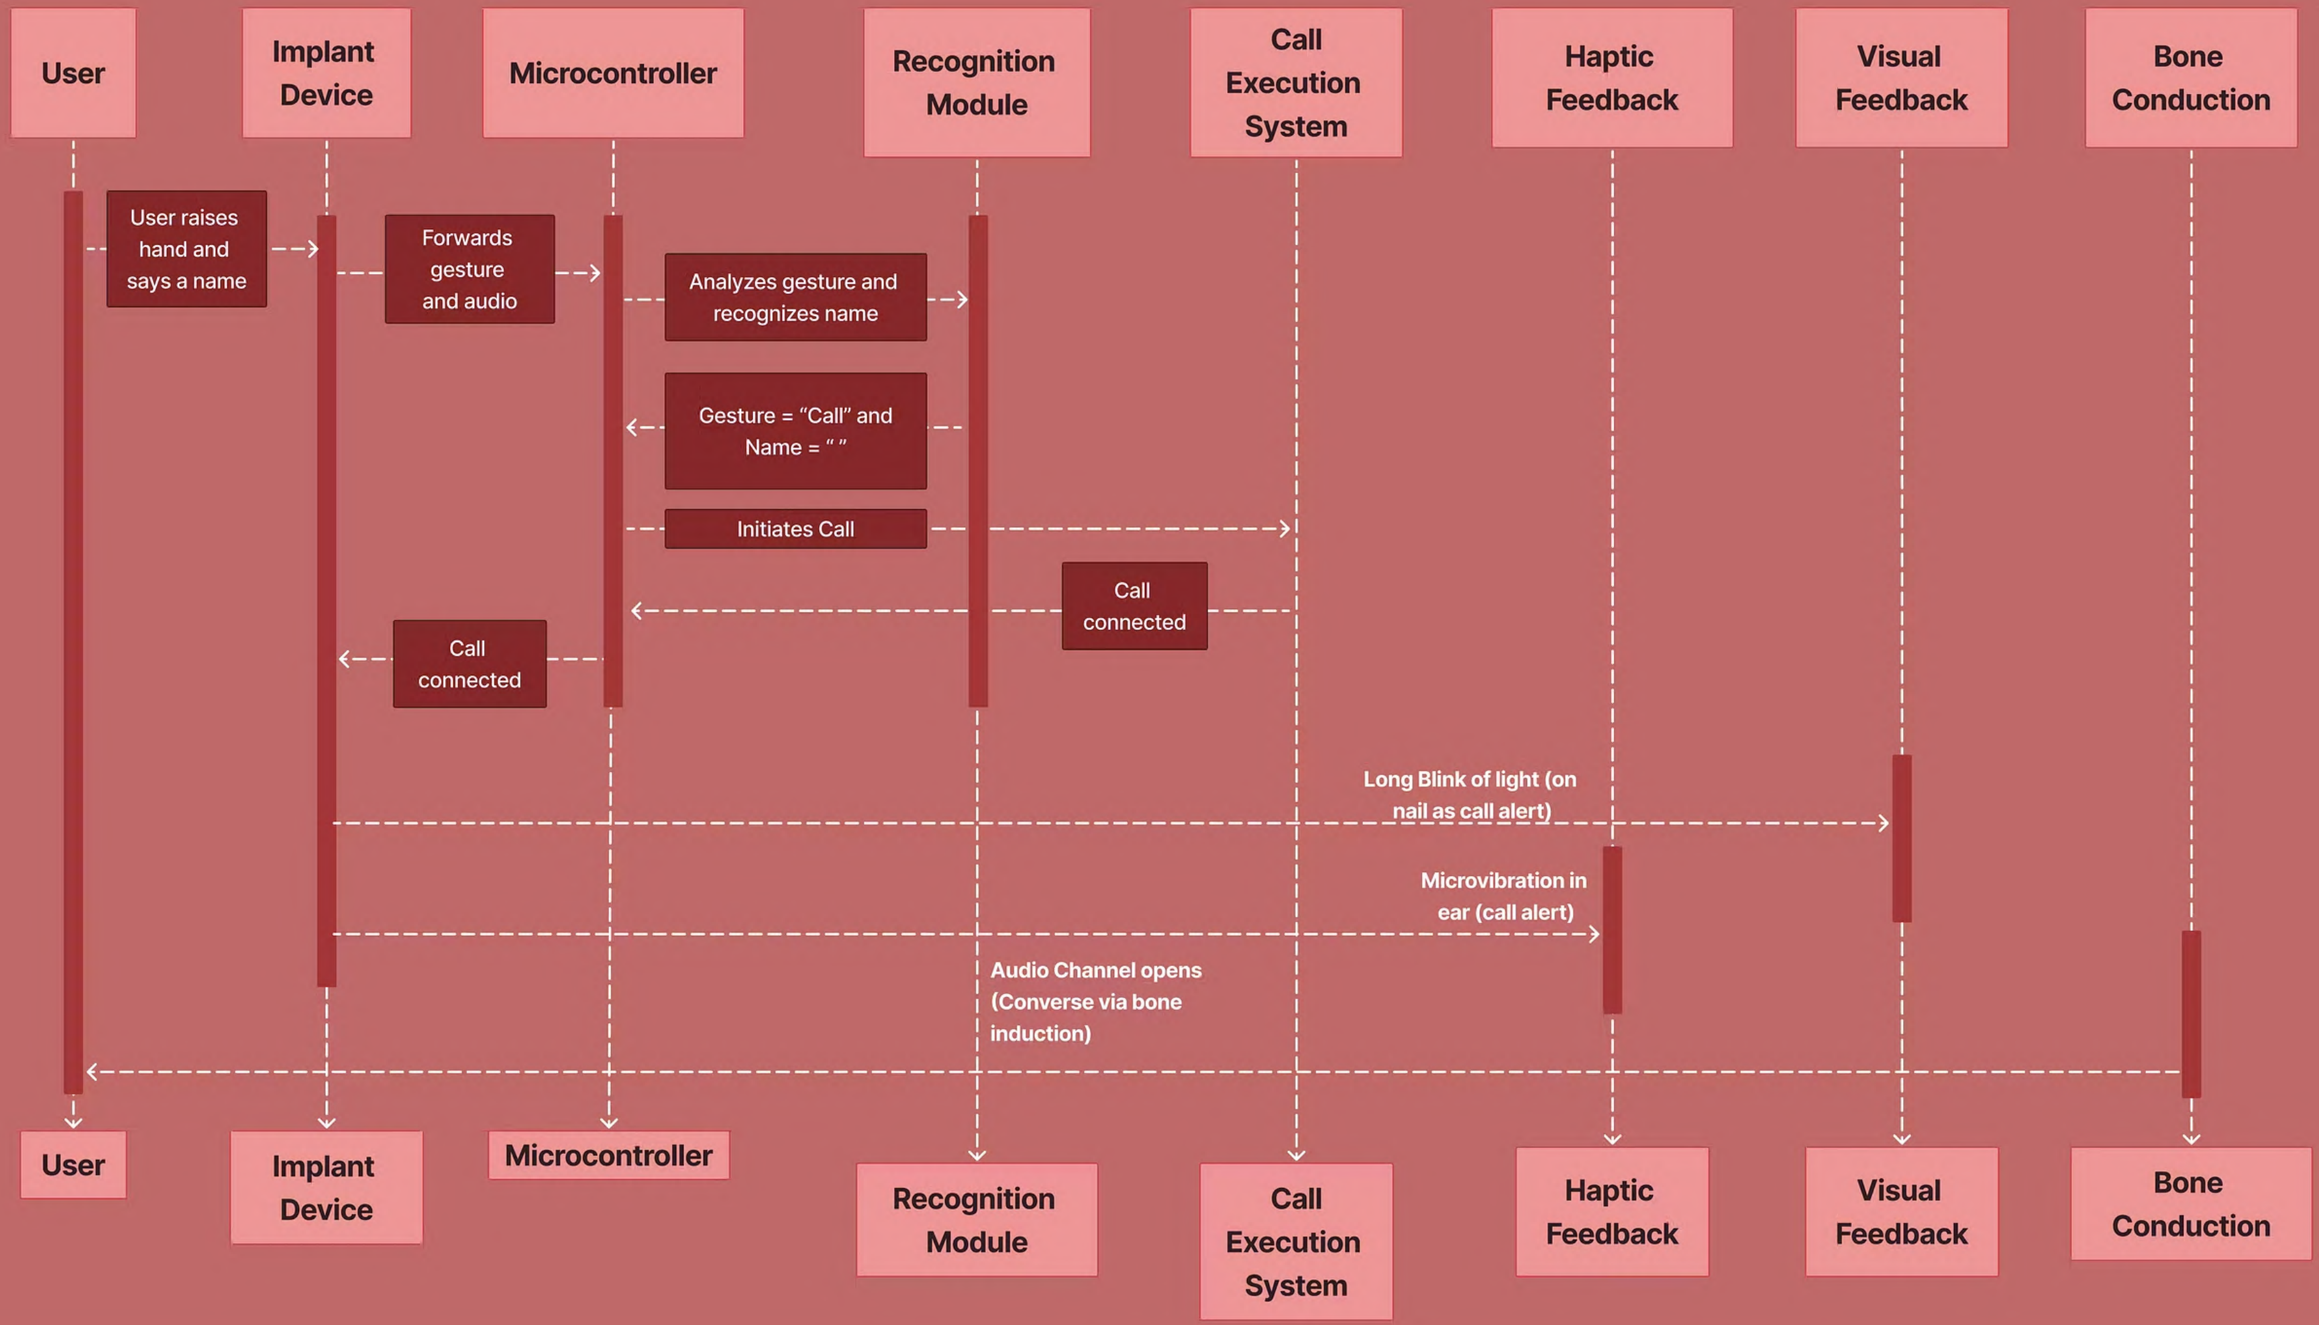

Supportive Materials : Biodegradable Resin or shell to house everything.

Thermal Sensors : Maxim Integrated Units

Glide Sensors : Inertial Measurement Units to record strokes and gliding gestures.

Interaction of sensing of temperature:

Try Pitch

How does a user know what's happening?

User will be feedbacked through soundless vibrations that will be conducted through Bone Conduction.

How does the device give feedback?

Device has multiple forms of feedbacks including Soundless Vibrations and skin pulses that can be developed in future.

How can interaction be made intuitive without visual cues?

The interactions can be more precise and intuitive without visual cues such as Clapping, Snapping fingers and Rolling of fingers.

Is the design inclusive and emotionally resonant?

Flicky can be made inclusive for people who do not have limbs by using Prosthetic fingers and wrap that can be attached to the limbs.
